Project Idea Form

Project Title:

InternSync – Cooperative Training Coordination and Tracking System

Project Overview:

InternSync is a role-based web platform that manages the complete life cycle of the cooperative training (Co-op) and summer internship program in one place, connecting students, company training supervisors, and academic supervisors. The system publishes training vacancies, ranks them against each student profile using a skill-matching engine, collects the weekly tasks and reports of the student, lets the company supervisor confirm attendance and submit periodic and final evaluations, and lets the academic supervisor review reports, check them for overlap with other submissions, and approve grades through a multi-stage approval workflow. At the end of the term the system exports the official grade sheets and academic reports without any manual re-entry of data.

Problem / Opportunity Addressed:

The cooperative training process is currently managed through email, spreadsheets, and paper forms. This produces the following problems:

- **Manual, blind matching:** vacancies are circulated informally, so students apply without knowing whether their skills fit, and coordinators match applicants to companies by hand.
- **Untracked weekly reporting:** reports arrive as email attachments, with no reliable record of who submitted what and when, and no automatic detection of late or missing submissions.
- **Fragmented evaluation:** company supervisors fill paper or PDF forms, usually only at the end of the training period, so there is no continuous performance record and no feedback loop for the student.
- **No academic-integrity check:** academic supervisors have no practical way to notice recycled or copied reports across students and across terms.
- **Slow, error-prone grading:** final grade sheets are compiled manually from scattered sources, which delays results and introduces mistakes.

The opportunity is to consolidate these scattered activities into one auditable system that enforces deadlines automatically, keeps a complete history of every submission and evaluation, and generates the official academic outputs directly from that history.

Intended Users and Stakeholders:

- **Student (primary user):** creates a profile, uploads a CV, browses and applies to matched vacancies, submits weekly tasks and reports, evaluates the training entity, and follows their own progress.
- **Company / training supervisor (external user):** confirms weekly attendance, submits periodic and final performance evaluations of the assigned student.
- **Academic supervisor (faculty):** reviews weekly reports, inspects the similarity indicator, requests revisions, and approves grades.
- **Co-op unit coordinator (department):** manages training cycles, the vacancy catalogue, deadlines, and exports official reports for the department.
- **System administrator:** manages accounts, roles, and permissions.
- **Indirect stakeholders:** the college administration, which needs accurate program statistics, and the partner companies, which need a reliable channel to reach qualified students.

Goals:

- Reduce the manual effort of matching students to vacancies by ranking each vacancy against the student profile automatically.
- Maintain a complete, timestamped, auditable record of every report, evaluation, and approval.
- Enforce submission deadlines automatically through scheduled reminders and late-submission flags.
- Support academic integrity by giving supervisors a similarity indicator across submitted reports.
- Eliminate manual re-entry by generating the official grade sheets and end-of-term reports directly from the stored data.
- Guarantee that no grade becomes final until every responsible role has approved it, through an explicit multi-stage approval workflow.
- Provide each role with a dashboard that shows exactly the pending actions and the current status of the training cycle.

Scope of the Project:

Included in the scope

- Role-based accounts, authentication, and authorization for the five user roles.
- Vacancy catalogue: creation and publication by the company or coordinator, browsing, filtering, and application by students.
- Matching engine that ranks vacancies against the student profile using text embeddings of the CV and the vacancy description, with a rule-based fallback (skill keywords, specialization, GPA) so the feature still works when no embedding data is available.
- Weekly task and report submission with file attachments, deadlines, and revision requests.
- Attendance confirmation by the company supervisor (a simple weekly confirmation record).
- Periodic and final evaluation forms, plus mutual evaluation in which the student evaluates the training entity.
- Similarity detection between reports stored inside the system, producing a flag for supervisor review.
- Multi-stage approval workflow for report acceptance and grade approval.
- Scheduled notification service (in-app and email reminders, late flags, escalation to the coordinator).
- Export of grade sheets and summary academic reports as PDF and Excel files.
- Role-specific dashboards and basic program statistics.

Excluded from the scope

- Live integration with the university student information system; student and course data will be imported through CSV files.
- Contracts, payroll, insurance, or any legal and HR processing with the partner companies.
- A native mobile application; the system will be delivered as a responsive web application.
- Plagiarism detection against the public internet or external databases; similarity is computed only against reports stored in the system, and the final judgment remains with the academic supervisor.
- Biometric or GPS-based attendance verification.
- Real-time chat between users; communication is limited to notifications and comments on submissions.

Main Tasks:

1. Requirements elicitation and analysis: stakeholder interviews, use cases, and user stories for the five roles, documented in an SRS.
2. System design: architecture, database schema (ERD), API specification, and UI wireframes.
3. Authentication, authorization, and role management module.
4. Student profile module: CV upload, storage, and extraction of skills from the CV.
5. Vacancy management module: create, publish, browse, filter, and apply.
6. Matching engine: embedding-based ranking of vacancies with a rule-based fallback.
7. Weekly report and task submission module, including file storage and deadline handling.
8. Attendance and evaluation module: attendance confirmation, periodic and final evaluation, mutual evaluation.
9. Similarity detection service across submitted reports.
10. Approval workflow engine: a multi-stage state machine covering report acceptance and grade approval.
11. Scheduled notification service: reminder, late-flag, and escalation jobs.
12. Reporting and export module: grade sheets and term summaries in PDF and Excel.
13. Role-based dashboards and program statistics.
14. Testing: unit, integration, and user-acceptance testing.
15. Deployment, user documentation, and the final presentation.
